ABSTRACT

The main results from about 7 years monitoring of aerosols radioactivity at BEO-Moussala have been presented. Big sampler, for ~ 15000m³ and low-background H.P.Ge gamma-spectrometer were used for collecting aerosols in the air and measuring of their radioactivity, respectively. For all observer time interval a single case of human done radioactivity was specified. No any influence of working nuclear energetic in RB and EU on air quality have been found.
